

Systems of Differential Equations: A First Look

Department of Mathematics

Salt Lake Community College

Systems of Differential Equations

Often a population study will involve two or more interacting species. This leads to two or more **coupled** differential equations. (Similar systems arise in electrical and mechanical engineering.)

Systems of Differential Equations

Often a population study will involve two or more interacting species. This leads to two or more **coupled** differential equations. (Similar systems arise in electrical and mechanical engineering.)

For example:

$$\begin{aligned}x' &= 2x - xy \\ y' &= -3y + 0.5y\end{aligned}$$

where we are looking for two functions x and y that both depend on t .

Systems of Differential Equations

Often a population study will involve two or more interacting species. This leads to two or more **coupled** differential equations. (Similar systems arise in electrical and mechanical engineering.)

For example:

$$\begin{aligned}x' &= 2x - xy \\ y' &= -3y + 0.5y\end{aligned}$$

where we are looking for two functions x and y that both depend on t .

A simpler case is where the equations in the system are **uncoupled**:

$$\begin{aligned}x' &= 2x \\ y' &= -3y\end{aligned}$$

Systems of Differential Equations

Often a population study will involve two or more interacting species. This leads to two or more **coupled** differential equations. (Similar systems arise in electrical and mechanical engineering.)

For example:

$$\begin{aligned}x' &= 2x - xy \\ y' &= -3y + 0.5y\end{aligned}$$

where we are looking for two functions x and y that both depend on t .

A simpler case is where the equations in the system are **uncoupled**:

$$\begin{aligned}x' &= 2x \\ y' &= -3y\end{aligned}$$

Analytic Definition of a Solution of a DE System

A **solution** of a system of two differential equations is a pair of functions $x(t)$ and $y(t)$ that simultaneously satisfies both equations.
