Counting

Colby Community College

Multiplication Counting Rule

For a sequence of events in which the first event can occur n_1 ways, the second event can occur n_2 ways, the third event can occur n_3 ways, and so on. The total number of outcomes $n_1 \cdot n_2 \cdot n_3 \cdot \cdots$.

Multiplication Counting Rule

For a sequence of events in which the first event can occur n_1 ways, the second event can occur n_2 ways, the third event can occur n_3 ways, and so on. The total number of outcomes $n_1 \cdot n_2 \cdot n_3 \cdot \cdots$.

Example 1

When making random guesses for an unknown four-digit passcode, each digit can be $0, 1, \ldots, 9$. What is the total number of different possible passcodes?

Multiplication Counting Rule

For a sequence of events in which the first event can occur n_1 ways, the second event can occur n_2 ways, the third event can occur n_3 ways, and so on. The total number of outcomes $n_1 \cdot n_2 \cdot n_3 \cdot \cdots$.

Example 1

When making random guesses for an unknown four-digit passcode, each digit can be $0, 1, \ldots, 9$. What is the total number of different possible passcodes?

There are 10 possible choices for each digit, so the total number of passcodes is $10 \cdot 10 \cdot 10 \cdot 10 = 10,000$.

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Factorial Rule

The number of different arrangements (where order matters) of n different items when all n items are selected is $n!$.

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Factorial Rule

The number of different arrangements (where order matters) of n different items when all n items are selected is $n!$.

Example 3

A researcher must visit the presidents of the Gallup, Neilsen, Harris, Pew, and Zogby polling companies.

- How many different travel iterations are there?

Definition

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Factorial Rule

The number of different arrangements (where order matters) of n different items when all n items are selected is $n!$.

Example 3

A researcher must visit the presidents of the Gallup, Neilsen, Harris, Pew, and Zogby polling companies.

- How many different travel iterations are there?
  $5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120.$

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Factorial Rule

The number of different arrangements (where order matters) of n different items when all n items are selected is $n!$.

Example 3

A researcher must visit the presidents of the Gallup, Neilsen, Harris, Pew, and Zogby polling companies.

- How many different travel iterations are there?
  $5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120$.
- What is the probability that the presidents are visited in order from younger to oldest?

Definition

The **factorial symbol (!)** denotes the product of decreasing positive whole numbers. By special definition, $0! = 1$.

Example 2

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Factorial Rule

The number of different arrangements (where order matters) of n different items when all n items are selected is $n!$.

Example 3

A researcher must visit the presidents of the Gallup, Neilsen, Harris, Pew, and Zogby polling companies.

- How many different travel iterations are there?
  $5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120$.
- What is the probability that the presidents are visited in order from younger to oldest? There is only one: $1/120 = .0083$.

Definition

When n different items are available and r of them are selected without replacement, the number of different permutations (where order counts) is given by

$$_nP_r = \frac{n!}{(n-r)!}$$

Definition

When n different items are available and r of them are selected without replacement, the number of different permutations (where order counts) is given by

$$_nP_r = \frac{n!}{(n-r)!}$$

Example 4

In a state lottery, 48 balls numbered 1 to 48 are placed in a machine. The balls are drawn without replacement, where the order determines the winning number.

How many possible lottery number are there?

Definition

When n different items are available and r of them are selected without replacement, the number of different permutations (where order counts) is given by

$$_nP_r = \frac{n!}{(n-r)!}$$

Example 4

In a state lottery, 48 balls numbered 1 to 48 are placed in a machine. The balls are drawn without replacement, where the order determines the winning number.

How many possible lottery number are there?

There are $n = 48$ balls and $r = 6$ are chosen, so the total number of permutations are:

$$_{48}P_r = \frac{48!}{(48-6)!} =$$

Definition

When n different items are available and r of them are selected without replacement, the number of different permutations (where order counts) is given by

$$_nP_r = \frac{n!}{(n-r)!}$$

Example 4

In a state lottery, 48 balls numbered 1 to 48 are placed in a machine. The balls are drawn without replacement, where the order determines the winning number.

How many possible lottery number are there?

There are $n = 48$ balls and $r = 6$ are chosen, so the total number of permutations are:

$$_{48}P_r = \frac{48!}{(48-6)!} = 8,835,488,640$$

Example 5

In a horse race, a trifecta bet is won by correctly selecting, in the correct order, the horses that finish first, second, and third. The 104th running Kentucky Derby has a field of 19 horses.

How many different trifecta bets are possible?

Example 5

In a horse race, a trifecta bet is won by correctly selecting, in the correct order, the horses that finish first, second, and third. The 104th running Kentucky Derby has a field of 19 horses.

How many different trifecta bets are possible?

There are $n = 19$ horses available, and we must select $r = 3$ of them without replacement. The number of permutations is

$$_{19}P_3 = \frac{19!}{(19-3)!} = 5814$$

Example 5

In a horse race, a trifecta bet is won by correctly selecting, in the correct order, the horses that finish first, second, and third. The 104th running Kentucky Derby has a field of 19 horses.

How many different trifecta bets are possible?

There are $n = 19$ horses available, and we must select $r = 3$ of them without replacement. The number of permutations is

$$_{19}P_3 = \frac{19!}{(19-3)!} = 5814$$

If a bettor randomly selects three horses for a trifecta bet, what is the probability of winning?

Example 5

In a horse race, a trifecta bet is won by correctly selecting, in the correct order, the horses that finish first, second, and third. The 104th running Kentucky Derby has a field of 19 horses.

How many different trifecta bets are possible?

There are $n = 19$ horses available, and we must select $r = 3$ of them without replacement. The number of permutations is

$$_{19}P_3 = \frac{19!}{(19-3)!} = 5814$$

If a bettor randomly selects three horses for a trifecta bet, what is the probability of winning?

There are 5814 arrangements of three horses, but only one of them will win the trifecta bet. So the probability is

$$P\left(\text{trifecta win}\right) = \frac{1}{5814} = .00017$$

Example 5

In a horse race, a trifecta bet is won by correctly selecting, in the correct order, the horses that finish first, second, and third. The 104th running Kentucky Derby has a field of 19 horses.

How many different trifecta bets are possible?

There are $n = 19$ horses available, and we must select $r = 3$ of them without replacement. The number of permutations is

$$_{19}P_3 = \frac{19!}{(19-3)!} = 5814$$

If a bettor randomly selects three horses for a trifecta bet, what is the probability of winning?

There are 5814 arrangements of three horses, but only one of them will win the trifecta bet. So the probability is

$$P\left(\text{trifecta win}\right) = \frac{1}{5814} = .00017$$

We are assuming that all horses are equally likely to win the Kentucky Derby. In practice, this is not true. Some horses are faster than others.

Definition

When n different items are available, but only r of them are selected without replacement, the number of different combinations (order does not matter) if found as follows

$$_nC_k = \binom{n}{k} = \frac{n!}{k!\,(n-k)!}$$

Definition

When n different items are available, but only r of them are selected without replacement, the number of different combinations (order does not matter) if found as follows

$$_{n}C_{k} = \binom{n}{k} = \frac{n!}{k!\,(n-k)!}$$

Example 6

How many five-card poker hands are there?

Definition

When n different items are available, but only r of them are selected without replacement, the number of different combinations (order does not matter) if found as follows

$$ {}_nC_k = \binom{n}{k} = \frac{n!}{k!\,(n-k)!} $$

Example 6

How many five-card poker hands are there?

$$ {}_{52}C_5 = \frac{52!}{5!\,(52-5)!} = 2,598,960 $$

Definition

When n different items are available, but only r of them are selected without replacement, the number of different combinations (order does not matter) if found as follows

$$_nC_k = \binom{n}{k} = \frac{n!}{k!\,(n-k)!}$$

Example 6

How many five-card poker hands are there?

$$_{52}C_5 = \frac{52!}{5!\,(52-5)!} = 2,598,960$$

Example 7

What is the probability that a poker hand will contain exactly two jacks?

Definition

When n different items are available, but only r of them are selected without replacement, the number of different combinations (order does not matter) if found as follows

$$_nC_k = \binom{n}{k} = \frac{n!}{k!\,(n-k)!}$$

Example 6

How many five-card poker hands are there?

$$_{52}C_5 = \frac{52!}{5!\,(52-5)!} = 2,598,960$$

Example 7

What is the probability that a poker hand will contain exactly two jacks?

$$\frac{(_4C_2)\,(_{48}C_3)}{_{52}C_5} = \frac{6 \cdot 17,296}{2,598,960} = \frac{103,776}{2,598,960} \approx 4\%$$

Example 8

What is the probability that a poker hand will contain a straight?

Example 8

What is the probability that a poker hand will contain a straight?

The lowest ranked straight is A,2,3,4,5 and the highest ranked straight is 10,J,Q,K,A. Thus, for the any of the ten ranks A through 10, we can build a straight. Each card can be from any of the four suits.
This means the probability is:

$$P\left(\text{straight}\right) = \frac{10\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)}{{}_{52}C_5} = \frac{10,240}{2,598,960} \approx 3.94\%$$

Example 8

What is the probability that a poker hand will contain a straight?

The lowest ranked straight is A,2,3,4,5 and the highest ranked straight is 10,J,Q,K,A. Thus, for the any of the ten ranks A through 10, we can build a straight. Each card can be from any of the four suits.
This means the probability is:

$$P\,(\text{straight}) = \frac{10\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)\left({}_4C_1\right)}{{}_{52}C_5} = \frac{10,240}{2,598,960} \approx 3.94\%$$

Example 9

What is the probability that a poker hand will contain a straight, but not a straight flush?

Example 8

What is the probability that a poker hand will contain a straight?

The lowest ranked straight is A,2,3,4,5 and the highest ranked straight is 10,J,Q,K,A. Thus, for the any of the ten ranks A through 10, we can build a straight. Each card can be from any of the four suits.
This means the probability is:

$$P\,(\text{straight}) = \frac{10\,({}_4C_1)\,({}_4C_1)\,({}_4C_1)\,({}_4C_1)\,({}_4C_1)}{{}_{52}C_5} = \frac{10,240}{2,598,960} \approx 3.94\%$$

Example 9

What is the probability that a poker hand will contain a straight, but not a straight flush?
We calculated in Example 7 the number of straights possible. Now, just need to subtract out the number of straight flushes.

$$P\,(\text{straight}) = \frac{10,240 - 40}{{}_{52}C_5} = \frac{10,200}{2,598,960} \approx 3.92\%$$
